the book presents a wide description of hydrographic conditions in the studied area of the norwegian and greenland seas variability of the atlantic water properties have been presented on the basis of time series obtained from oceanographic measurements

performed each summer from 2000 to 2007 by the institute of oceanology polish academy of sciences the warming observed in that period has been described in detail as well as cooling of the atlantic water flowing towards the fram strait in 2007 furthermore concepts regarding multi branch structure of the west spitsbergen current have been presented types of flows in individual branches as well as variability of the flows description of the structure transports and variability of the sea currents is based mostly on hydrographic measurements and baroclinic calculations the results confirm a leading role of the ocean in climate shaping and acknowledges the importance of the thermohaline circulation for the climate

my work geochemistry of organic matter in the ocean first appeared in russian in 1978 since then much progress has been made in the exploration of various forms of organic matter in the ocean dissolved colloidal organic matter suspended in particles and that contained in bottom sediments and in interstitial waters the appropriate evidence is found in hundreds of articles and several review works such as andersen 1977 biogeochimie de la matiere organique a l'interface eau sediment-marine 1980 duursma and dawson 1981 a great amount of new information has been obtained in the soviet union's scientific institutions on the composition and distribution in natural waters and bottom sediments of organic matter and its separate components playing a crucial role in the formation of the chemical and biological structure of the ocean and its productivity in the biogeochemistry of the elements and geochemistry of organic matter in the earth's sedimentary cover the areas of exploration have expanded over the past four and a half years to embrace many new little known regions including the arctic seas in contrast to the three preceding decades the research has been focused on investigating the existing forms the distribution and accumulation of organic matter in near continental oceanic zones between land and sea and in river estuaries

due to its particular characteristics the mediterranean sea is often viewed as a microcosm of the world ocean its proportionally reduced dimensions and peculiar hydrological circulation render it susceptible to environmental and climatic constraints which are rapidly evolving the mediterranean is therefore an ideal site to examine in order to better understand a number of key oceanographic phenomena this is especially true of the ligurian sea where due to its geology oceanic conditions are found close to the coast as such 30 years ago an offshore time series site provided a fresh impetus to a long history of marine biology research which has generated a very important body of data and knowledge this is the first volume in a two volume series that summarizes this research across these two books the reader will find 13 chapters that examine the geology physics chemistry and biology of the ligurian sea always with the goal of providing key elements of oceanography in a changing world

the search for an accurate knowledge of the transfer of energy and water in our climate system and of all participating processes is still a burning issue within environmental and climate research more reliable ways should be found to model them in their complex interplay with cascades of processes in that system and their impact on all our resources on earth such modelling needs also validation with accurate and complete observations which in turn should also enable to observe variations of climate components these are the goals of the global energy and water experiment gewex which began its work about 8 years ago many advanced remote sensing capabilities have now been developed of which only a few will enter into satellite based platforms these new developments should be brought to the attention of a broader community of younger scientists in particular of those countries which quite recently could open their borders for free exchanges

the sea is a prestigious series with a history going back to the classic three volume treatise published by wiley in 1962 63 now under the leadership of allan robinson the series is again being extended with five new volumes currently planned that emphasizing the interaction of physical chemical and biological oceanography coastal ocean phenomena is the first of these new volumes and it deals with the general principles governing ocean phenomena in regions of shallower water near land processes such as tidal effects global sea level changes biological productivity and sediment transport are analyzed models and methods are emphasized including remote sensing models of coastal ocean circulation and data acquisition volume 10 presents the general principles and volume 11 is organized geographically to presents the results of 35 of regional studies eastern north america the caribbean the north sea and baltic the mediterranean sea and so forth volume 10 is a readable and systematic introduction to coastal oceanography that is suitable for use with college courses while volume 11 is a much larger reference work note that volumes 10 and 11 are available together as a set isbn 0471 11543 6 tent 175 00
